AB Substituent effects on aurophilic interactions were explored by single-crystal x-ray diffraction methods for Au(I) complexes of monodentate phosphines, R'₃P-Au-X (X = Cl, Sph, and Spy). When a CF₃ substituent is introduced at a meta position of the Ph ring in Ph₃P, aurophilicity was accrued in ClAuP(m-CF₃C₆H₄)₃. However, aurophilicity was weakened by introducing two CF₃ groups at both meta positions. When a CF₃ substituent is substituted for a H atom in the para position or when a CH₃ substituent is introduced in the meta and/or para positions, such an effect was not obsd. for R'₃PAuCl and R'₃PAuSph. Most dimers constructed by aurophilicity appear to be reinforced by .pi.-.pi. interactions between the Ph ring of the Sph ligand or the pyridine ring of the Spy ligand and one of the Ph rings in the R'₃P ligand. A novel ladder-like supra mol. architecture is created in the crystal of {3,5-(F₃C)₂C₆H₃}₃PAuSph, and a tetramer is formed in the crystal of Ph₃PAuSpy by aurophilic and .pi.-.pi. interactions. Substituent effects on important bond lengths are discussed.

I

AB Reaction of aq. IrCl₃ with fluorinated 2-arylpyridines in the presence of AgO₂CCF₃ afforded fifteen fac-tris-cyclometalated arylpyridine Ir complexes (e.g., I) exhibiting excellent processing and electroluminescent properties which can be fine-tuned via systematic control of the nature and position of the substituents on the arom. rings. Single-crystal x-ray structures were obtained for I and three other analogous cyclometalated arylpyridine Ir complexes. Nearly all the arylpyridine Ir complexes exhibited fully reversible redn. and oxidn. waves.

 OS CASREACT 127:95391
 AB Formation of the N-arylated .eta.3-aza-TMM complexes of iridium from regioselective hydroanilination of an octahedral (.eta.1-allenyl)iridium complex has been studied. (OC-6-42)-Ir(Cl)(PPh₃)₂(OTf)(CO)(.eta.1-CHCCH₂)(2) undergoes the substitution of L (L = NH₃, NH₂NH₂, MeNH₂, EtNH₂, iPrNH₂, PhCH₂NH₂) for the triflate ligand to yield {(OC-6-42)-Ir(Cl)(PPh₃)₂(L)(CO)(.eta.1-CHCCH₂)}(OTf) (3d-i). In contrast, the reactions of 2 with XC₆H₄NH₂ (X = F, NO₂, MeO, H, Me), Ph₂NH, and Ph(Me)NH result in regioselective addn. at the allenyl ligand, thereby generating the N-arylated .eta.3-aza-TMM complexes 5a-g. The mechanistic studies confirm that the hydroanilination is preceded by the formation of an aniline-ligated intermediate. The crystal structure of (OC-6-42)-Ir(Cl)(PPh₃)₂(NHSO₂Ph)(CO)(.eta.1-CHCCH₂), {Ir(Cl)(PPh₃)₂(CO)[.eta.3-CH₂C(NPh₂)CH₂]}(OTf) (5f), and {Ir(Cl)(PPh₃)₂(CO)[.eta.3-CH₂C(NPhMe)CH₂]}(OTf) (5g) were detd.

 AB Treatment of the tetrafluoroethylene complex, $\text{IrCl}(\eta^2\text{-C}_2\text{F}_4)(\text{PPh}_3)_2$, (1), with HCl or Cl_2 gives $\text{IrCl}_2(\text{CF}_2\text{CF}_2\text{H})(\text{PPh}_3)_2$ (2) or $\text{IrCl}_2(\text{CF}_2\text{CF}_2\text{Cl})(\text{PPh}_3)_2$ (3), resp. These coordinately unsatd. complexes react with various neutral ligands to give stable, six-coordinate, tetrafluoroethyl and halotetrafluoroethyl complexes. The single crystal x-ray structure of one of these compds., the carbonyl deriv. of 3, $\text{IrCl}_2(\text{CF}_2\text{CF}_2\text{Cl})(\text{CO})(\text{PPh}_3)_2$ was detd. The acetonitrile deriv. of 2, $\text{IrCl}_2(\text{CF}_2\text{CF}_2\text{H})(\text{CH}_3\text{CN})(\text{PPh}_3)_2$ undergoes a reaction with HCl that proceeds through the intermediate fluorocarbene complex, $[\text{IrCl}_2(\text{:CFCF}_2\text{H})(\text{CH}_3\text{CN})(\text{PPh}_3)]^+$, to give, upon hydrolysis, $\text{IrCl}_2(\text{C}[\text{O}]\text{CF}_2\text{H})(\text{CH}_3\text{CN})(\text{PPh}_3)_2$ (19). The acetonitrile ligand, by virtue of its position trans to the acyl group, can be thermally displaced from 19 to give $\text{IrCl}_2(\text{C}[\text{O}]\text{CF}_2\text{H})(\text{PPh}_3)_2$ (20). The vacant coordination site in 20 can be filled by other neutral ligands. Thermal treatment of any of the acyl complexes results finally in a reverse migration process and formation of $\text{IrCl}_2(\text{CF}_2\text{H})(\text{CO})(\text{PPh}_3)_2$.

 AB The oxidative addn. of trifluoromethanesulfonyl chloride to trans-[IrX(CO)(PPh₃)₂] yields as the only product an Ir(III) complex, [IrXCl(OS(O)CF₃)(CO)(PPh₃)₂] (X = Cl, Br) in which the O-sulfinato group is trans to the carbonyl ligand. This is in contrast to the behavior of hydrocarbon sulfonyl halides which give exclusively S-bonded forms with the sulfinato group trans to chloride. The S- and O,O'-trifluoromethanesulfinato isomers of the compd. [IrCl₂(O₂SCF₃)(PPh₃)₂] were prepd. and characterized. Addn. of CO or pyridine to either of these isomers gives [IrCl₂(S(O)O₂CF₃)(PPh₃)₂L] (L = CO or C₅H₅N) in which the added Lewis base is trans to an S-sulfinato group.

 AB The chlorobis(ethylene)iridium(I) dimer, $[\text{IrCl}(\text{C}_2\text{H}_4)_2]_2$ and acetylacetonatobis(ethylene)iridium(I), $\text{Ir}(\text{acac})(\text{C}_2\text{H}_4)_2$, react with C_2F_4 to give mixed ethylenetetrafluoroethylene complexes, in which the ethylene ligand may be replaced by alkenes such as cyclooctene and 1,5-cyclooctadiene. A no. of neutral ligands can be added to these complexes with or without alkene substitution. In several complexes a strong ir-absorption in the region 1350-1500 cm^{-1} is attributed to (C:C)-stretching of the fluoroalkene. PMR expts. with $\text{Ir}(\text{acac})(\text{C}_2\text{H}_4)_2$ and $\text{Ir}(\text{acac})(\text{C}_2\text{H}_4)(\text{C}_2\text{F}_4)$ indicated that the rate of associative ethylene exchange and the barrier to rotation around the metal-ethylene bond were related to the basicity of the metal substrate. Alkene addn. is discussed in terms of nucleophilic attack of the metal on the empty antibonding alkene-orbitals.

AB Abstraction of iodide from $\text{Ir}(\text{CF}_3)\text{ClI}(\text{CO})(\text{PPh}_3)_2$ by AgSbF_6 in the presence of acetonitrile yields the cationic complex $[\text{Ir}(\text{CF}_3)\text{Cl}(\text{MeCN})(\text{CO})(\text{PPh}_3)_2]^+ [\text{SbF}_6]^-$ (I). The acetonitrile group of I is readily displaced, and I reacts with p-tolyl isocyanide to yield $[\text{Ir}(\text{CF}_3)\text{Cl}(\text{CNC}_6\text{H}_4\text{Me}-4)(\text{CO})(\text{PPh}_3)_2]^+ [\text{SbF}_6]^-$ (II). The addn. of NaOMe to II results in the methoxy ester complex $\text{Ir}(\text{CF}_3)(\text{COOMe})\text{Cl}(\text{CNC}_6\text{H}_4\text{Me}-4)(\text{PPh}_3)_2$. The acetonitrile ligand of I is also displaced by anions, including H^- . Thus I reacts with LiEt_3BH to give $\text{Ir}(\text{CF}_3)\text{HCl}(\text{CO})(\text{PPh}_3)_2$ (III), in which the hydrido and trifluoromethyl ligands are mutually trans. In contrast, the addn. of excess NaBH_4 to I affords the novel dihydrido complex $\text{trans-IR}(\text{CF}_3)\text{H}_2(\text{CO})(\text{PPh}_3)_2$ (IV). Investigations into the potential use of III and IV as precursors of an Ir(I) complex such as $\text{Ir}(\text{CF}_3)(\text{CO})(\text{PPh}_3)_2$ are also described.

AB The present invention is generally directed to luminescent lanthanide compds. with phosphine oxide, phosphine oxide-sulfide, pyridine N-oxide, and phosphine oxide-pyridine N-oxide **ligands**, esp. with .beta.-enolate co-**ligands**. It also relates to thin film OLED electronic devices in which the active layer includes the photoactive lanthanide complex. Thus, Tb(PMBP)3(F5tpO)2 [PMBP = 4-isobutyryl-3-methyl-1-phenyl-5-pyrazolate, F5tpO = tris(pentafluorophenyl)phosphine oxide] was prepd. and its electroluminescent properties were measured along with 7 other prepd. complexes. Thin layer OLED devices were prepd. including a hole transport layer, electroluminescent layer comprising the lanthanide complexes of the invention, and at least one electron transport layer. Various hole and electron transport materials are also claimed. Cyclometalated iridium complexes derived from (un)substituted 2-phenylpyridines are preferred.
